## ON NEW EXAMPLES OF HYPOCRITICAL GROUPS

S.V. SKRESANOV

ABSTRACT. A group  $G$  is called *hypocritical* if whenever  $G$  lies in a locally finite variety generated by a section closed class of groups  $\mathfrak{X}$ , then  $G$  belongs to  $\mathfrak{X}$ . We prove that some coprime extensions of a  $p$ -group are hypocritical. The first example is given when such a  $p$ -group is nonabelian.

**Keywords:** locally finite varieties, finite groups, extraspecial  $p$ -groups.

## 1. INTRODUCTION

Recall that a group  $G$  is a *section* of a group  $F$  if there exists a subgroup  $H$  of  $F$  such that  $G$  is a homomorphic image of  $H$ . A class of groups  $\mathfrak{X}$  is said to be *section closed* if sections of groups from  $\mathfrak{X}$  also belong to it.

L.F. Harris [1] introduced the following definition: a group  $G$  is called *hypocritical* if whenever  $G$  lies in a locally finite variety generated by a section closed class of groups  $\mathfrak{X}$ , then  $G$  lies in  $\mathfrak{X}$ . It is easy to see that a hypocritical group is in fact critical, that is, does not lie in a variety generated by its proper sections.

A group with a unique minimal normal subgroup is called *monolithic* and the minimal normal subgroup is the *monolith* of the group. By the Remak theorem, every critical and thus hypocritical group must be monolithic. L.F. Harris [1] mentions that the converse is true when the monolith is nonabelian, but gives no reference. A restricted version of this result was established in [2, Theorem 4] and we prove this fact in general (see Proposition 1).

In this work we consider finite groups which are coprime extensions of finite  $p$ -groups. By the well-known Schur–Zassenhaus theorem, these extensions are split, so we actually work with semidirect products of the form  $D = B \rtimes A$ , where  $B$  is a  $p$ -group and  $A$  is a  $p'$ -group. Suppose that  $B$  is abelian. Then for  $D$  to be

hypocritical (or at least critical), the group  $A$  must act indecomposably on  $B$ , which is possible only if  $B$  is homocyclic (see [3, Theorem 5.2.2]). In this situation, by [1, Theorem 1], if the group  $D$  is hypocritical and  $B$  is not cyclic or elementary abelian, then the exponent of  $B$  is bounded in terms of  $|A|$  and  $p$ .

Consider the excluded possibilities for  $B$ . In the case when  $B$  is elementary abelian, it is easy to establish that  $D$  is hypocritical (see Proposition 2). Let now  $B$  be cyclic. In the same paper, L.F. Harris mentioned that the hypocriticality of  $D$  in this case was shown by R.M. Bryant and L.G. Kovács before, but we found no traces of the original proof. Moreover, the situation when  $B$  is cyclic is closely connected with the following problem due to L.G. Kovács (Problem 8.23 in the *Kourovka notebook* [4]): if the dihedral group  $D$  of order 18 is a section of a direct product  $X \times Y$ , must at least one of  $X$  and  $Y$  have a section isomorphic to  $D$ ? In Lemma 1 we show that for finite groups  $X$  and  $Y$  that question is equivalent to checking hypocriticality of  $D$ . Note that some partial results on Kovács' problem were obtained in [5]. Here we provide the proof in the cyclic case in general.

**Theorem 1.** *Let  $p$  be a prime, and let  $D = B \rtimes A$  be a semidirect product of its subgroups  $B$  and  $A$ , where  $B$  is a finite cyclic  $p$ -group and  $A$  is a  $p'$ -group acting faithfully on  $B$ . Then  $D$  is hypocritical.*

Theorem 1 implies that the main difficulty in Kovács' problem appears when groups  $X$  and  $Y$  are not locally finite.

Now we turn to the case when  $B$  is nonabelian. The smallest example occurs when  $D$  is equal to a semidirect product of the quaternion group  $Q_8$  and the cyclic group  $C_3$ , that is,  $D \simeq SL_2(3)$ . Recall that a finite  $p$ -group  $E$  is called *extraspecial*, if its center  $Z(E)$ , Frattini subgroup  $\Phi(E)$  and derived subgroup  $E'$  coincide and have order equal to  $p$ . Notice that  $Q_8$  is a 2-generated extraspecial group and it turns out that we can prove our result in the general case of a 2-generated extraspecial group.

**Theorem 2.** *Let  $p$  be a prime, and let  $D = E \rtimes A$  be a semidirect product of its subgroups  $E$  and  $A$ , where  $E$  is a 2-generated extraspecial  $p$ -group and  $A$  is a  $p'$ -group acting faithfully and irreducibly on  $E/\Phi(E)$ . Then  $D$  is hypocritical.*

As we will see, the proof of Theorem 2 does not depend on  $E$  being 2-generated until the last step, which gives the hope of proving the similar statement for a general extraspecial group. Having Harris' results in mind, one can conjecture that a necessary condition for a group  $D$  to be hypocritical is that  $|E/\Phi(E)|$  is bounded by some function of  $p$  and  $|A|$ , though no examples of such behavior were found so far.

The structure of the rest of this paper is as follows. In Section 2 we reduce the problem to studying sections of direct products and obtain some general results in that setting. As a simple corollary we prove the proposition about groups with a nonabelian monolith and establish some additional constraints on groups involved in the case of finite groups. Section 3 provides the proof of Theorem 1, while Section 4 section deals with Theorem 2.

## 2. REDUCTION LEMMATA

**Lemma 1.** *A finite group  $D$  is hypocritical if and only if whenever it is a section of a direct product  $X \times Y$  of finite groups  $X$  and  $Y$ , then  $D$  is a section of either  $X$  or  $Y$ .*

*Proof.* Suppose  $D$  is hypocritical. Obviously finite groups  $X$  and  $Y$  generate a locally finite variety and  $D$  belongs to it. By the definition of hypocriticality we get that  $D$  is a section of either  $X$  or  $Y$ .

Let  $\mathfrak{V}$  be a locally finite variety generated by a section closed class of groups  $\mathfrak{X}$  and suppose that  $D$  lies in  $\mathfrak{V}$ . By [6, Lemma 4.3], the group  $D$  is a section of a direct product of a finite number of groups from  $\mathfrak{X}$ , i.e.  $D$  is a section of  $X_1 \times \cdots \times X_n$ ,  $n \geq 1$ , and  $X_i, i = 1 \dots n$ , lie in  $\mathfrak{X}$ . Note that the definition of a section implies the existence of a subgroup  $G$  of  $X_1 \times \cdots \times X_n$  such that  $D$  is a quotient of  $G$ .

Let  $H$  be a normal subgroup of  $G$  with  $D \simeq G/H$ . For each element of  $D$  we can pick a corresponding preimage in  $G$ . Let  $M$  be a subgroup of  $G$  generated by those preimages. Obviously  $M$  is finitely generated and since it lies in a locally finite group,  $M$  is finite. By definition,  $HM = G$ , hence  $D \simeq G/H \simeq M/(M \cap H)$ . Replacing  $G$  by  $M$ , we may assume  $G$  to be finite.

Clearly we can replace groups  $X_i$  by projections of  $G$  on corresponding factors of this direct product, and as  $\mathfrak{X}$  is section closed, we can assume groups  $X_i$  to be finite. Now, inducting on  $n$  and applying the hypothesis we derive that  $D$  is a section of one of  $X_i$ , thus it lies in  $\mathfrak{X}$  as needed.  $\square$

Let  $G$  be a subgroup of a direct product  $F = X \times Y$  of groups  $X$  and  $Y$ . Then let  $G_X$  and  $G_Y$  denote the projections of  $G$  on  $X$  and  $Y$  respectively. We think of  $G_X$  and  $G_Y$  as of subgroups of  $F$ .

**Lemma 2.** *Let  $G$  be a subgroup of  $F = X \times Y$  and let  $X = G_X$  and  $Y = G_Y$ . If  $H$  is normal in  $G$ , then  $H_X$  and  $H_Y$  are normal in  $F$ .*

*Proof.* A projection on  $X$  is a homomorphism from  $G$  into  $X$ . Under our conditions this map is surjective, thus  $H_X$  is a normal subgroup of  $X$ . The group  $Y$  centralizes  $X$  in  $F$ , so  $H_X$  is actually a normal subgroup of  $F$ . The proof is similar for  $H_Y$ .  $\square$

**Lemma 3.** *Let  $F = X \times Y$  be a direct product of groups, and let  $G$  be a subgroup of  $F$ . Suppose also that  $H$  is a normal subgroup of  $G$ . Then there exist groups  $\hat{X}, \hat{Y}, \hat{G}$  and  $\hat{H}$  such that  $\hat{G}, \hat{X}$ , and  $\hat{Y}$  are sections of  $G, X$ , and  $Y$  respectively,  $\hat{H}$  is normal in  $\hat{G}$  and the following hold:*

- (i)  $\hat{X} = \hat{G}_{\hat{X}}$  and  $\hat{Y} = \hat{G}_{\hat{Y}}$ ;
- (ii)  $\hat{G}/\hat{H}$  is isomorphic to  $G/H$ ;
- (iii) if  $\hat{K}_1 = \hat{G} \cap \hat{G}_{\hat{X}}$  and  $\hat{K}_2 = \hat{G} \cap \hat{G}_{\hat{Y}}$ , then  $\hat{K}_1 \cap \hat{H} = \hat{K}_2 \cap \hat{H} = 1$ .

*Proof.* In the following we are going to repeatedly replace groups  $G, X$  and  $Y$  by their sections, preserving the same symbols for brevity. The groups  $\hat{G}, \hat{X}$ , and  $\hat{Y}$  can be thought of as the final “product” of this process.

It is easy to see that  $G$  is a subgroup of  $G_X \times G_Y$ , thus we can always assume that  $X = G_X$  and  $Y = G_Y$ . By Lemma 2 the groups  $H_X$  and  $H_Y$  are normal in  $F$ . Then  $L_1 = H \cap H_X$  and  $L_2 = H \cap H_Y$  are normal in  $G$ , but obviously  $(L_1)_X = L_1$  and  $(L_2)_Y = L_2$ , so  $L_i, i = 1, 2$ , are actually normal in  $F$  by another application of Lemma 2.

Consider the quotient group  $F/(L_1 \times L_2)$ :

$$F/(L_1 \times L_2) \simeq G_X/L_1 \times G_Y/L_2 \text{ and } (G/(L_1 \times L_2))/(H/(L_1 \times L_2)) \simeq G/H.$$

Therefore replacing our groups appropriately, we can assume that  $L_1 = L_2 = 1$ . As a consequence, if we take  $K_1 = G \cap G_X$  then  $H \cap K_1 = H \cap H_X = 1$ . The similar equality is true for  $K_2 = G \cap G_Y$ .  $\square$

**Lemma 4.** *Let  $F = X \times Y$  be a direct product of groups, and let  $D$  be a monolithic subgroup of  $F$ . Then  $D$  is a section of  $X$  or  $Y$ .*

*Proof.* Denote by  $K_1$  and  $K_2$  kernels of projection maps from  $D$  into  $Y$  and  $X$  respectively. Subgroups  $K_i \cap D$ ,  $i = 1, 2$  are normal in  $D$  and intersect trivially. Since  $D$  is monolithic, it follows that  $K_1 \cap D$  or  $K_2 \cap D$  is trivial, which gives us an embedding of  $D$  into  $Y$  or  $X$ , as wanted.  $\square$

Now we are ready to resolve the case of a group with a nonabelian monolith.

**Proposition 1.** *Let  $D$  be a finite monolithic group with a nonabelian monolith. Then  $D$  is hypocritical.*

*Proof.* By Lemma 1 it is sufficient to prove that for all finite groups  $X$  and  $Y$ , if  $D$  is a section of  $F = X \times Y$  then  $D$  is a section of either  $X$  or  $Y$ . Suppose that  $D$  is a section of neither  $X$  nor  $Y$ . Let  $G$  be a subgroup of  $F$  and let  $H$  be a normal subgroup of  $G$ , such that  $D \simeq G/H$ . Denote by  $K_1$  and  $K_2$  kernels of projections of  $G$  into  $Y$  and  $X$  respectively and notice that  $K_1 = G \cap G_X$  and  $K_2 = G \cap G_Y$ . By Lemma 3 we can choose groups  $X$  and  $Y$  in such a way that  $K_1 \cap H = K_2 \cap H = 1$ . Note also that  $K_1 \cap K_2 = 1$ .

Now set  $L = K_1H \cap K_2H$ . Obviously  $H \leq L$ . The groups  $K_i$ ,  $i = 1, 2$ , and  $H$  are normal in  $G$ , and consequently  $[K_1, K_2] = [K_1, H] = [K_2, H] = 1$ . Therefore,

$$[L, L] \leq [K_1H, K_2H] = [K_1, K_2][K_1, H][H, K_2][H, H] = [H, H] \leq H.$$

It follows that  $L/H$  is an abelian normal subgroup of  $G/H \simeq D$  and thus it cannot contain the monolith of  $D$ , so in fact  $H = L$ .

As  $H = K_1H \cap K_2H$ , we easily obtain an embedding of  $D \simeq G/H$  into the direct product  $G/K_1H \times G/K_2H$ . The factors of this direct product do not have  $D$  as a section (because otherwise  $X$  or  $Y$  would), so we can now assume that  $D$  is a subgroup of  $F$ . Lemma 4 gives us the final contradiction.  $\square$

If a finite monolithic group has an abelian monolith, it must be an elementary abelian  $p$ -group for some prime  $p$ . In this situation and when groups involved are finite, we obtain a refinement of Lemma 3.

**Lemma 5.** *In the notation of Lemma 3, suppose that groups  $X$  and  $Y$  are finite, and the group  $D \simeq G/H$  has an abelian monolith  $K$ . Then we can assume that  $\hat{H}$  is a  $p$ -group, where  $p$  is a prime dividing  $|K|$ .*

*Proof.* As in the proof of Lemma 3, we will drop “hats” from our symbols.

Pick the group  $G$  to be of minimal order such that  $G$  satisfies the conclusion of Lemma 3. Let  $M$  be a maximal subgroup of  $G$  and suppose that  $H$  does not lie in  $M$ . Then  $HM = G$  and  $M/(M \cap H) \simeq G/H \simeq D$ , so we can replace  $G$  by  $M$ . But  $M$  has a smaller order than  $G$ , which contradicts the minimality condition, thus actually  $M$  includes  $H$ .

The Frattini subgroup is an intersection of maximal subgroups of a group, and by the preceding paragraph  $H$  lies in all maximal subgroups of  $G$ . Therefore,  $H$  lies in the Frattini subgroup of  $G$  which is nilpotent by [3, Theorem 6.1.6], so  $H$  is nilpotent too.

As  $H$  is nilpotent, it contains a Hall  $p'$ -subgroup  $S$ . It is characteristic in  $H$  so it is normal in  $G$ . Set  $L = K_1S \cap K_2S$ . Then  $L$  is a normal subgroup of  $G$  and obviously  $S \leq L$ . Let  $R$  be a Sylow  $p$ -subgroup of  $L$ . We have  $R \leq K_1S$ . As  $S$  is a

$p'$ -group and  $K_1$  is a normal subgroup of  $K_1S$ , it contains all Sylow  $p$ -subgroups of  $K_1S$  and  $R$  in particular. In other words,  $R \leq K_1$  and by symmetry  $R \leq K_2$ . But  $K_1 \cap K_2 = 1$  because  $G_X \cap G_Y = 1$ . Thus,  $R = 1$  and  $L$  is a  $p'$ -group.

Now we have that  $|LH : H| = |L : L \cap H|$  is a  $p'$ -number, so  $LH/H$  is a normal  $p'$ -subgroup of  $G/H \simeq D$ . The monolith of  $D$  is a  $p$ -group and thus it intersects  $LH/H$  trivially, which implies that  $LH/H = 1$ . Consequently,  $LH = H$  and  $L \leq H$ .

Notice that  $D$  is a section of  $\tilde{F} = G/K_1S \times G/K_2S$ . Indeed,  $G/L$  is a subgroup of  $\tilde{F}$  and  $D \simeq G/H \simeq (G/L)/(H/L)$ . Suppose  $L \neq 1$ . Applying Lemma 3 to the groups  $G/L$ ,  $H/L$ ,  $G/K_1S$ , and  $G/K_2S$ , we get a contradiction with the minimality of  $G$ . Then  $S \leq L$  must be trivial. It follows that  $H$  is a  $p$ -group.  $\square$

**Proposition 2.** *Let  $D = B \rtimes A$  be a semidirect product of a finite elementary abelian  $p$ -group  $B$  and a  $p'$ -group  $A$ . Suppose also that  $A$  acts faithfully and irreducibly on  $B$ . Then  $D$  is hypocritical.*

*Proof.* By Lemma 1 we can consider the following situation: let  $X$  and  $Y$  be finite groups, and let  $G$  be a subgroup of  $X \times Y$ . Denote by  $H$  the normal subgroup of  $G$ , such that  $D \simeq G/H$ . By Lemma 5 we can assume that  $H$  is a  $p$ -group. Denote by  $P$  a Sylow  $p$ -subgroup of  $G$ . Notice that  $H \leq P$  and  $P$  is normal in  $G$ .

Since the action of  $A$  on  $B$  is faithful,  $B$  is a minimal normal subgroup of  $D$ . Now, let  $N$  be a normal subgroup of  $D$ , such that  $N \cap B = 1$ . Then  $N$  centralizes  $B$ , and by the conjugacy part of the Schur–Zassenhaus theorem, we have  $N \leq A$ . The action of  $A$  on  $B$  is faithful, hence  $N = 1$ , so  $D$  is in fact monolithic.

The proof goes by contradiction. Let  $K_1$  be a kernel of the projection from  $G$  into  $Y$ . If  $K_1$  is trivial, then  $G$  (and thus  $D$ ) is a section of  $Y$ , so we can assume  $K_1 > 1$ . Then  $K_1H/H$  is a nontrivial normal subgroup of  $G/H$ , and therefore  $P \leq K_1H$ . We have

$$P \leq P \cap K_1H = (P \cap K_1)H \leq P,$$

so  $(P \cap K_1)H = P$ . But since  $P/H$  is elementary abelian,  $H$  lies in  $\Phi(P)$ , thus  $P \cap K_1 = P$ . Then  $H \leq P \leq K_1$ , and we derive  $H = 1$  which gives us the contradiction with Lemma 4.  $\square$

### 3. PROOF OF THEOREM 1

Recall that  $D = B \rtimes A$  is a semidirect product of its subgroups, where  $B$  is a cyclic  $p$ -group of order  $p^n$  and  $A$  is a group of order coprime to  $p$ . In order to prove hypocriticality of  $D$ , we first need one simple lemma.

**Lemma 6.** *The group  $D$  is monolithic and its monolith has order  $p$ .*

*Proof.* Let  $K$  be the unique subgroup of order  $p$  in  $B$ . Obviously  $K$  is normal in  $D$ . We prove that  $K$  is the monolith of  $D$ .

Let  $N$  be a nontrivial normal subgroup of  $D$ . Suppose that  $N$  is a  $p'$ -group. Clearly  $N \cap B = 1$  and therefore  $N$  centralizes  $B$ . Since  $AN$  is a  $p'$ -group,  $|AN|$  divides  $|D : B| = |A|$ , hence  $N \leq A$ . So  $A$  has nonidentity elements centralizing  $B$  contrary to our hypothesis. Thus,  $|N|$  is divisible by  $p$ .

Since the group  $B$  is a normal Sylow  $p$ -subgroup of  $D$ , the groups  $B$  and  $N$  intersect nontrivially. Then  $K \leq B \cap N \leq N$ , which proves the claim.  $\square$

We need the following general lemma.

**Lemma 7.** *Let  $P$  be a finite  $p$ -group and let  $Q$  be a  $p'$ -group acting on  $P$  by automorphisms. Suppose that  $H$  is a normal  $Q$ -invariant subgroup of  $P$ , such that the quotient  $P/H$  is cyclic. Then there exists a cyclic  $Q$ -invariant subgroup  $C$  of  $P$ , such that  $HC = P$ .*

*Proof.* Note that the case  $P = H$  is trivial, thus from now on we will suppose that  $H < P$ . Choose the smallest subgroup  $C$  of  $P$ , such that  $C$  is  $Q$ -invariant, and  $HC = P$ . We prove that  $C$  is cyclic.

Notice that  $H \cap C$  is a normal subgroup of  $C$  and  $C/(H \cap C) \simeq P/H$  is cyclic. Let  $L = H \cap C$ . Since  $H < P$ , we have  $L < C$ , and therefore  $\Phi(C)L < C$ . The group  $C/(\Phi(C)L)$  is cyclic and elementary abelian, hence  $|C/(\Phi(C)L)| = p$ . Then the group  $(\Phi(C)L)/\Phi(C)$  is a  $Q$ -invariant subgroup of index  $p$  in  $C/\Phi(C)$ , and by Maschke's theorem, there exists a  $Q$ -invariant group  $T$ , such that

$$T/\Phi(C) \times (\Phi(C)L)/\Phi(C) = C/\Phi(C),$$

and  $T/\Phi(C)$  has order  $p$ . We derive that  $T\Phi(C)L = C$ , so  $TL = C$ . Then

$$TH = TLH = CH = P,$$

where the first equality holds because  $L \leq H$ . Since  $T \leq C$ , and  $C$  was chosen to be minimal satisfying the required properties, we obtain  $T = C$ . But  $|T/\Phi(C)| = p$ , so  $|C/\Phi(C)| = p$ , which proves that  $C$  is cyclic.  $\square$

The proof of the theorem goes by contradiction. By Lemma 1 we can assume that  $D$  is a section of a direct product of finite groups  $X$  and  $Y$  and as usual, denote by  $G$  a subgroup of  $X \times Y$  and by  $H$  a normal subgroup of  $G$  such that  $D \simeq G/H$ . Also, let  $K_1$  and  $K_2$  be kernels of projections of  $G$  into  $Y$  and  $X$  respectively. By Lemma 6 and Lemma 5, we can assume  $H$  to be a  $p$ -group. Notice also that  $K_1 \cap K_2 = 1$ .

Let  $P$  be a Sylow  $p$ -subgroup of  $G$ . Obviously  $H$  lies in  $P$ , so  $P$  is normal in  $G$ . We have  $|G : P| = |D : B| = |A|$ , thus  $|P|$  is coprime to  $|G : P|$ , and by the Schur–Zassenhaus theorem, there exists a  $p'$ -subgroup  $Q$  of  $G$ , such that  $PQ = G$ .

Lemma 7 implies the existence of a cyclic  $Q$ -invariant subgroup  $C$  of  $P$ , such that  $HC = P$ . Let  $R = CQ$ . Then we have

$$D \simeq G/H = PQ/H = HCQ/H \simeq R/(R \cap H).$$

It follows that  $D$  is a quotient of  $R$ , and the action of  $Q$  on  $C$  is faithful and nontrivial, since the action of  $A$  on  $B$  is so.

The group  $R$  is a semidirect product of a cyclic  $p$ -group  $C$  and a cyclic  $p'$ -group  $Q$ , thus Lemma 6 applies. Then  $R$  is monolithic, and by Lemma 4, the group  $R$  can be embedded in  $X$  or  $Y$ , which in its turn shows that  $D$  is a section of one of these groups. That contradicts the choice of  $X$  and  $Y$ , proving the theorem.

#### 4. PROOF OF THE THEOREM 2

Recall that  $D = E \rtimes A$  is a semidirect product of its subgroups, where  $E$  is an extraspecial 2-generated  $p$ -group, and  $A$  is a group of order coprime to  $p$ , acting faithfully and irreducibly on  $E/\Phi(E)$ .

**Lemma 8.** *Let  $N$  be a normal subgroup of  $D$ . Then either  $E \leq N$  or  $N \leq E$ . As a consequence,  $D$  is monolithic.*

*Proof.* Let  $Q$  be a normal subgroup of  $A$ . Consider  $N_E(Q)$ . It is obviously an  $A$ -invariant subgroup of  $E$  and hence  $\Phi(E)N_E(Q)$  is an  $A$ -invariant subgroup of  $E$ . The action of  $A$  on  $E/\Phi(E)$  is irreducible, therefore we have either  $\Phi(E)N_E(Q) = E$  or  $\Phi(E)N_E(Q) = \Phi(E)$ . In the first case,  $N_E(Q) = E$ , and it follows that  $Q$  is a normal subgroup of  $D = EA$ . Then  $Q$  centralizes  $E$ , and thus the action of  $A$  on  $E/\Phi(E)$  is not faithful, which is a contradiction. Therefore,  $\Phi(E)N_E(Q) = \Phi(E)$ , so  $N_E(Q) \leq \Phi(E)$  and finally  $N_D(Q) = AN_E(Q) \leq A\Phi(E)$ .

Let  $N$  be a normal subgroup of  $D$  and suppose that  $N$  is not contained in  $E$ . Then  $N$  is not a  $p$ -group, and hence  $N$  intersects  $A$  nontrivially. The group  $Q = N \cap A$  is a normal subgroup of  $A$ , so by the result of the previous paragraph,  $N_D(Q) \leq A\Phi(E)$ . Notice that if  $N$  intersected  $E$  trivially, then  $N$  would lie in  $A$  and therefore  $Q = N$ . Then  $D = N_D(N) \leq A\Phi(E)$ , which gives us a contradiction. Thus,  $N$  intersects  $E$  nontrivially and hence contains  $Z(E) = \Phi(E)$ .

We have  $|N : N \cap A| = |NA : A|$ , and since  $NA$  is a subgroup of  $G$ , the latter index is a  $p$ -number. Hence,  $Q$  is a Hall  $p'$ -subgroup of  $N$ . Obviously  $E \cap N$  is a Sylow  $p$ -subgroup of  $N$ , therefore  $N = (E \cap N)Q$ , and by the Schur–Zassenhaus theorem, all complements to  $E \cap N$  in  $N$  are conjugate. Then the Frattini-type argument applies and we derive:

$$D = NN_D(Q) \leq N\Phi(E)A = NA,$$

where the last equality holds because  $\Phi(E) \leq N$ . Now  $D = NA$  and as  $A$  is a  $p'$ -group, we have  $E \leq N$  as claimed.

Let  $N$  be a minimal normal subgroup of  $D$ . Obviously a minimal normal subgroup cannot contain  $E$ , since otherwise  $\Phi(E)$  lies in  $N$  and is a smaller normal subgroup of  $D$ . Therefore, the group  $N$  lies in  $E$ , so  $\Phi(E) \leq N$  and hence by minimality  $\Phi(E) = N$ .  $\square$

The proof of Theorem 2 goes by contradiction and starts similarly to the proof of Theorem 1. By the consequential application of Lemma 1 and Lemma 5, we arrive at the following situation:  $D$  is isomorphic to  $G/H$ , where  $G$  is a subgroup of a direct product  $X \times Y$ ,  $H$  is a normal subgroup of  $G$ , groups  $X$  and  $Y$  are finite and finally  $H$  is a  $p$ -group. As usual, denote by  $K_1$  and  $K_2$  kernels of projections of  $G$  onto  $Y$  and  $X$  respectively. By Lemma 3 we have  $H \cap K_1 = H \cap K_2 = 1$ . Clearly  $K_1 \cap K_2 = 1$ .

Suppose also that our groups are picked to be the minimal counterexample subject to  $|G|$ . We note that neither of  $K_i$ ,  $i = 1, 2$ , can be trivial, since otherwise  $G$  would be a subgroup of  $X$  or  $Y$ , which obviously contradicts the assumption that those groups do not contain  $D$  as a section. Also by Lemma 4 the group  $H$  cannot be trivial as well.

Let  $P$  be a Sylow  $p$ -subgroup of  $G$ . Obviously  $P$  is normal in  $G$ , the group  $H$  is contained in  $P$  and by the Schur–Zassenhaus theorem there exists a complement  $Q$ , such that  $G = PQ$  and  $Q \simeq A$ . Note also that  $P/H \simeq E$ .

**Lemma 9.** *We can assume that  $P \not\leq K_1H$ .*

*Proof.* Suppose that  $P \leq K_1H$ . Set  $M = K_1Q$ . Then

$$M/(M \cap H) = MH/H = K_1QH/H = G/H \simeq D,$$

so  $G = M = K_1Q$  by the minimality of  $G$ . In that situation the  $p$ -part of  $|G|$  must divide  $|K_1|$ , hence  $P \leq K_1$ . But  $H \leq P$ , thus  $H = H \cap P \leq H \cap K_1 = 1$ , which gives us the contradiction.  $\square$

The group  $K_1$  is normal in  $G$ , hence  $HK_1/H$  is normal in  $G/H$ . By Lemma 8, the group  $HK_1/H$  either contains  $P/H$  or is contained in it, therefore  $HK_1 \leq P$  or  $P \leq HK_1$ . The second case does not occur by Lemma 9, so  $K_1$  lies in  $P$  and is, therefore, a  $p$ -group. By the similar argument,  $K_2$  is a  $p$ -group as well.

We prove that  $K_i$ ,  $i = 1, 2$ , have order  $p$ . Notice first that since  $A$  acts irreducibly on  $E$ , the only normal  $A$ -invariant subgroups of  $E$  are the identity subgroup,  $\Phi(E)$  and  $E$  itself. The action of  $Q$  on  $P/H$  is similar, thus the same applies to  $Q$ -invariant subgroups of  $P/H$ . Now,  $K_1H/H$  is a nontrivial  $Q$ -invariant subgroup of  $P/H$ . It cannot be equal to  $P/H$ , since by Lemma 9, the group  $P$  is not contained in  $K_1H$ . Then the only option is  $K_1H/H \simeq \Phi(E)$ , therefore  $K_1 \simeq K_1H/H$  has order  $p$ . By the identical reasoning,  $K_2$  also has order  $p$ .

Now we claim that  $\Phi(P) = HK_1$ .

Obviously  $\Phi(P) \leq HK_1$ , because  $P/HK_1$  is elementary abelian. Suppose that  $\Phi(P) < HK_1$ . Denote by  $\bar{\phantom{x}} : P \rightarrow P/\Phi(P)$  the natural homomorphism from  $P$  onto  $P/\Phi(P)$ . Clearly  $HK_1 < P$ , thus  $\overline{HK_1}$  is a nontrivial proper  $Q$ -invariant subgroup of  $\bar{P}$ . By Maschke's theorem there exists a nontrivial proper  $Q$ -invariant subgroup  $\bar{L}$  of  $\bar{P}$  such that  $\bar{P} = \overline{HK_1} \times \bar{L}$ . Notice that  $\overline{HK_1} \cap \bar{L} = 1$ .

Let  $L$  be the full preimage of  $\bar{L}$ . Then  $\Phi(P) < L < P$  and  $L$  is a normal  $Q$ -invariant subgroup of  $P$ . Hence,  $HL/H$  is a normal  $Q$ -invariant subgroup of  $P/H$  and thus it is either trivial or equal to the whole of  $P/H$  or equal to  $HK_1/H$  (which is the derived subgroup of  $P/H$ ). In the first case,  $HL = H$ , therefore  $L \leq H$  and hence  $\Phi(P) \leq H$ . But  $P/H$  is nonabelian, so this case does not occur. In the second case  $HL = P$ . Set  $R = LQ$ . Then  $RH = PQ = G$  and  $R/(R \cap H) \simeq D$ , thus by the minimality of  $G$ , we have  $G = R$  and  $L = P$  which is a contradiction. Therefore, the only option is  $HL = HK_1$ , so  $L \leq HK_1$ . It follows that  $\bar{L} \leq \overline{HK_1}$  and together with  $\bar{L} \cap \overline{HK_1} = 1$  we have  $\bar{L} = 1$ , which gives us a contradiction. Hence,  $\Phi(P) = HK_1$  and the claim is proved.

We show now that  $P/P'$  is homocyclic. Denote by  $\bar{\phantom{x}} : P \rightarrow P/P'$  the natural homomorphism from  $P$  onto  $P/P'$ . Suppose  $\bar{P}$  is not homocyclic and then by [3, Theorem 5.2.2] it decomposes into a nontrivial direct product of  $Q$ -invariant subgroups  $\bar{L}$  and  $\bar{M}$ . Let  $L$  and  $M$  be the full preimages of these subgroups. Note that they are proper  $Q$ -invariant subgroups of  $P$  and that  $P = LM$ .

Notice that  $L$  and  $M$  cannot be subgroups of  $\Phi(P)$  at the same time, since otherwise  $P = \Phi(P)$  which is not the case. Without loss of generality, suppose that  $L \not\leq \Phi(P)$ . Therefore,  $L\Phi(P)/\Phi(P)$  is a nontrivial proper  $Q$ -invariant subgroup of  $P/\Phi(P)$  which is impossible, since  $Q$  acts irreducibly on  $P/\Phi(P)$ . This is a contradiction, thus  $P/P'$  is homocyclic.

Let  $T$  be a  $p$ -group. Denote by  $\Omega_1(T)$  the subgroup generated by all elements of order dividing  $p$  in  $T$ , i.e.  $\Omega_1(T) = \langle x \in T \mid x^p = 1 \rangle$ .

Suppose that  $K_1 \not\leq P'$ . Again, let  $\bar{\phantom{x}} : P \rightarrow P/P'$  denote the natural homomorphism from  $P$  onto  $P/P'$ . Then  $\overline{K_1}$  is a  $Q$ -invariant subgroup of  $\bar{P}$  of order  $p$ . Therefore,  $\overline{K_1}$  lies in  $\Omega_1(\bar{P})$  and hence the action of  $Q$  on  $\Omega_1(\bar{P})$  is not irreducible. Obviously the action of  $Q$  on  $\Omega_1(\bar{P})$  is equivalent to the action of  $Q$  on  $\bar{P}/\Phi(\bar{P}) \simeq P/\Phi(P)$ , so the latter is not irreducible as well, giving us a contradiction. Thus,  $K_1$  must be contained in  $P'$  and by the similar argument the same is true for  $K_2$ .

Now we use  $\bar{\phantom{x}} : P \rightarrow P/K_1$  to denote a natural homomorphism from  $P$  onto  $P/K_1$ . Notice that  $K_1K_2 \leq P'$ , so  $\overline{P'}$  is nontrivial. Obviously  $\overline{P'}$  is the derived

subgroup of  $\overline{P}$  and since  $\overline{P}$  is nilpotent, we have  $[\overline{P'}, \overline{P}] < \overline{P'}$ . Clearly  $[\overline{P'}, \overline{P}] = [\overline{P'}, \overline{P}]$  which yields  $[P', P]K_1 < P'$ .

Until now we have not used the fact that  $E$  is 2-generated. Applying it, we deduce that  $P$  is also 2-generated, because

$$P/\Phi(P) = P/HK_1 \simeq (P/H)/(HK_1/H) \simeq E/\Phi(E).$$

Therefore  $P'/[P', P]$  is cyclic.

Since  $P'/(H \cap P') \simeq HP'/H$  has order  $p$ , the intersection  $H \cap P'$  is a maximal subgroup of  $P'$ . The quotient  $P/H$  is extraspecial, so  $[P', P]$  lies in  $H$ . Hence  $(H \cap P')/[P', P]$  is the maximal subgroup of a cyclic group  $P'/[P', P]$ . By above arguments,  $[P', P]K_1/[P', P]$  is a proper subgroup of  $P'/[P', P]$ , so it is contained in  $(H \cap P')/[P', P]$ . Therefore  $K_1 \leq H$ . However  $K_1 \cap H = 1$ , thus  $K_1 = 1$ , which gives us the final contradiction.
